FIRE DOORS

FOR FIRE COMPARTMENTATION

An approved access or fire door construction can prevent the passage of fire for up to two hours. Designed, manufactured, installed and maintained to specification, these doors provide protection within a building and are integral to the safety of its occupants. Adequate fire and smoke protection can be affected by details such as the door and frame construction type and dimensions, position of door within a designated compartment area, closer control system, door gap seals, speed of door operation and ironmongery used.

Working with the latest in fire door technology these constructions are fitted to your project specification requirements by a team of specialist installers achieving the necessary protection and finish.
